

University of Rajshahi
Dept. Of Computer Science and Engineering
B. Sc. Engineering. 2nd Year 2nd Semester Examination 2025
Course: CSE2252 (Web Application Development Lab)

Set-2

Use Git to clone the following repository into your computer.

https://github.com/m-r-kushal/lab_2252_2025_set2.git

1. In the cloned repository, open the **task1** folder. Edit the **index.html** file and perform the following DOM manipulation using JavaScript:
 - a) Write a click event handler to the "**Change Font Size**" button to change the font size of all `<li>` items in the `<ul>` to **24px**.
 - b) Write a click event handler to the "**Add Item at Top**" button to insert a new `<li>` with the text "**Item n**" at the beginning of the `<ul>`. (Here **n** = current list item count + 1.) The new `<li>` must have the class **item**.
 - c) Add a **keyup** event listener to the input field so that as you type, the text inside `<div id="output">` shows the input text in **UPPERCASE**.
2. Build a **Meal Info** React app as described below.
 - a) In the cloned repository, create a new React project named **task2**, install the project dependencies and run the React app.
 - b) Create a component "**src/CategoryPage.jsx**" containing a "**View Meal Categories**" button and show it in the app. When user clicks the button, the app will asynchronously call **API-1** (details below) to fetch all meal categories and display the name and image of each category.
 - c) Add a text input and a "**Search**" button to the page. When user clicks the button, call **API-2** with the text typed in the input and display the names of all matching meals on the same page. If no meal is found, show the text "**No meals found**".

API Details:

API-1: List of Meal Categories

Call Signature: <https://www.themealdb.com/api/json/v1/1/categories.php>

API-2: Search Meals By Name

Call Signature: <https://www.themealdb.com/api/json/v1/1/search.php?s={name}>

Example: <https://www.themealdb.com/api/json/v1/1/search.php?s=chicken>
